

CLR Connection Center

Standard Operating Procedures Manual

West Capital Lending

April 2026 · Version 1.0

ABOUT THIS MANUAL

The definitive reference guide for Client Liaison Representatives, CLR-Admins, and platform administrators operating the CLR Connection Center. This manual documents every standard procedure, escalation path, compliance control, and system setting required to run the platform consistently and correctly across the team.

CONTENTS

Table of Contents

A complete map of the procedures, roles, and system controls covered in this manual.

HOW TO USE THIS MANUAL

Procedures are organized by role and daily workflow. CLRs should focus on Sections 2, 4, and 5. Admins must be fluent in Sections 3, 7, 10, and 11. Every user should review the Quick Reference Card in Section 13 and keep it accessible during their shift.

SECTION 1

Overview

1.1 What is CLR Connection Center?

CLR Connection Center is the internal platform used by West Capital Lending's Client Liaison Representative (CLR) team to manage daily outreach, Loan Officer (LO) assignments, appointments, end-of-day reporting, and team performance. The platform replaces ad-hoc spreadsheets and messaging tools with a single system of record for how leads move from initial contact to a completed LO transfer.

At its core, CLR Connection Center answers four questions every day: Who should each CLR call? Which LO should receive the transfer? What appointments are outstanding? And how did the team perform? Every procedure in this manual supports one of these four outcomes.

1.2 Who Uses It and Their Roles

The platform recognizes three role types. Each role determines which pages are visible, which actions are permitted, and whether the user appears in the daily assignment generation.

CLR	Standard Client Liaison Representative. Calls leads, logs appointments, submits EOD reports. Appears in the daily assignment generation.
Admin-CLR	Hybrid role. Performs all CLR duties and appears in assignment generation, AND has access to admin controls, override powers, and settings.
Admin-only	Manages the platform, users, algorithm weights, and system credentials. Does NOT appear in the daily assignment generation and is not assigned leads.

1.3 How to Log In

The platform is a web application. It works in any modern browser, and does not require a VPN or a corporate desktop.

PRODUCTION URL

Access the platform at <https://web-production-b6285.up.railway.app>. Bookmark it on your work machine. Credentials are issued by an administrator; if you lock yourself out, use the password reset flow on the login page.

1.4 Navigation Overview

The left navigation is organized into six menu groups. Every user sees Main, Team, Reports, Tools, and Help. Admin is visible only to Admin-CLR and Admin-only roles.

Main	Dashboard, Your Calling List, Appointments. The day-to-day CLR workspace.
Team	Team Chat, Team Stats. Internal collaboration and performance visibility.
Reports	EOD Reporting, Historical Reports. Submit and review end-of-day activity.
Tools	LO Management, NMLS Compliance Checks, Lead Mailbox link, Bonzo link.
Admin	Manage Users, Settings, History / Audit Log, Override controls. Admins only.
Help	This SOP manual, platform changelog, and support contact details.

PERMISSIONS AT A GLANCE

Menu items you cannot access are hidden, not disabled. If a teammate sees a button you do not, it is because their role has that permission. Role changes are made by an admin in Admin → Manage Users.

Session and Security

Sessions expire after a period of inactivity. Always log out when you step away from a shared machine. Do not share credentials; every action you take is attributed to your account in the audit log, and your role determines what you are allowed to change.

SECTION 2

Daily CLR Workflow

2.1 A CLR's Day, Step by Step

The following ten-step procedure describes a complete CLR shift from login to EOD submission. Follow it in order. Each step corresponds to a specific screen or action in the platform.

- 01 Log in.** Open the production URL and sign in with your company credentials. If your password was recently reset, confirm the new one works before your first call block.
- 02 Check the Dashboard.** The first card shows your Upcoming Appointments count. Any future appointments you own appear here. Use this metric to plan your first hour.
- 03 Open "Your Calling List."** This is the day's assignment generated by the algorithm. It lists the LOs you should route transfers to, in priority order, based on availability, performance, and workload balance.
- 04 If no list has been generated yet and you are an admin:** navigate to Settings → Generate Daily Assignments. Confirm the date is today, review the preview, and commit. Assignments lock after generation — see Section 3 for the override procedure.
- 05 Call leads and assign to LOs per the list.** Work top-down through Your Calling List. Do not skip LOs without cause; the algorithm has already accounted for priority and capacity.

06 Log any appointments made. Every scheduled callback or live meeting goes in the Appointments tab. Capture the lead name, LO, date/time, and any context that will help the LO prepare. Missing appointments cause missed transfers.

07 Complete appointments as they finish. Open the appointment and use the Complete dialog. Mark the outcome as Transfer (call connected and handed off) or Fell Through (the lead did not convert). These outcomes feed your Team Stats.

08 Check Team Chat. Throughout the day, watch Team Chat for platform updates, LO status changes, and urgent notes from admins. The menu shows a notification bubble when you have unread messages.

09 End of day: complete the EOD Report. Open the EOD Reporting tab. Transfer and appointment counts are auto-tallied from the day's activity. Fill in the free-text field for anything notable not already captured.

10 Submit the EOD report. Submission emails the report to Scott Petrie and Chris Redoble and clears the EOD popup reminder. Only submit after your final call of the day is logged.

NEVER SKIP THE EOD

The EOD Reporting submission is not optional. It is how managers confirm daily transfer counts and identify LO coverage gaps. The EOD popup reminder will continue to appear on every login until the report for the previous working day is submitted.

2.2 Workflow Checklist

Print or pin this short checklist to your workspace. It mirrors the ten-step procedure above but is faster to scan at the start and end of each shift.

Start of Shift	Sign in • Review Dashboard • Open Your Calling List • Confirm list exists for today • Scan Team Chat for overnight notes.
Mid-Shift	Work the calling list top-down • Log every appointment as it is booked • Complete appointments with correct outcome • Check Team Chat periodically.
End of Shift	Close all completed appointments • Open EOD Reporting • Verify auto-tallied counts • Add notable items not otherwise captured • Submit report.
Escalate Immediately	Missing calling list • Bad LO data • Email delivery failures • Algorithm produced wrong assignment • EOD popup stuck on login.

SHIFT HANDOFF

If you are ending a shift that another CLR will continue, post a short summary in Team Chat: outstanding appointments, any LO who went offline unexpectedly, and any leads that need a specific callback window. Written handoffs prevent dropped transfers.

SECTION 3

LO Assignment System

3.1 How the Algorithm Works

Daily assignments are generated by a weighted algorithm that ranks every active LO against every CLR for the day. The algorithm produces Your Calling List — an ordered list of LOs for each CLR to route transfers to, optimized for conversion, fairness, and capacity. Six factors feed the ranking:

1. Performance	Historical transfer-to-close conversion rate over the rolling performance window. Higher conversion raises an LO's weight.
2. Workload Balance	How many leads the LO has already received in the current period. Distributes volume so no single LO is oversaturated.
3. State Licensing	Whether the LO holds an active NMLS license in the lead's state. Unlicensed matches are excluded, not just penalized.
4. Priority Tier	Manual tier set in LO Management (Standard = tier 2). Higher-tier LOs get precedence before ties are broken by performance.
5. Availability	Morning vs. afternoon window set on the LO's profile. Matches the lead call-time to the LO's declared hours.
6. Recency	How recently the LO received a transfer from the same CLR. Prevents clustering and keeps assignments distributed across the day.

ALGORITHM WEIGHTS ARE TUNABLE

Each factor has a weight configurable in Admin → Settings. Defaults are calibrated for the current book of business and should only be modified by an admin with a clear rationale. All weight changes are captured in the audit log (Section 10.6).

3.2 Daily Generation and Locking

Generation runs once per day. Admin-CLRs or Admins trigger it from Settings → Generate Daily Assignments. The preview screen lists every CLR with their ordered LO list; review it before committing. Once committed, the day's assignments are **locked** — no further generation is permitted against the same date without an override.

Locking is intentional. It prevents inconsistent mid-day re-shuffles that would orphan leads or double-assign LOs. If reality changes during the day — an LO goes offline, a CLR calls out sick — use the manual adjustment tools on the LO's profile rather than re-generating the list.

3.3 Past Dates Are Blocked

The generator will not run for any date earlier than the system's current date. If you attempt to select yesterday (or earlier) in the date picker, the Generate button disables and a message appears explaining the block. This is a hard rule and is enforced server-side; there is no user-level override.

WHY PAST DATES ARE BLOCKED

Historical reporting and EOD reconciliation both rely on the immutability of past assignments. Allowing back-dated generation would retroactively change transfer attribution, corrupt Team Stats, and break audit trail integrity. If data for a past day is wrong, correct it through manual appointment edits — never through a re-generation.

3.4 Admin Override Procedure

Rarely, an admin must re-generate today's list — for example, if the initial run used stale LO availability data. The Override flow exists for these cases and is deliberately friction-heavy.

- 01** Admin opens Settings → Generate Daily Assignments. If a list already exists, the primary button reads **Override and Regenerate** instead of **Generate**.
- 02** Clicking Override opens a modal requiring a **written reason**. Blank or trivial reasons (fewer than 15 characters) are rejected.
- 03** A **triple confirmation** follows: confirm the date is correct, confirm you understand the existing list will be replaced, and confirm you have communicated the change to affected CLRs.
- 04** On final confirmation, the system writes an entry to the audit trail including the admin's name, timestamp, the prior list, the new list, and the written reason.
- 05** All active users receive a Team Chat notification that the day's assignments have been regenerated, with a link to the audit entry.

OVERRIDE IS THE LAST RESORT

Only admins can unlock the day. Every override is logged and reviewed by management. If you find yourself overriding more than once a week, escalate to leadership — something upstream (stale LO data, algorithm weights, workflow gap) is the real problem.

3.5 LO Availability Settings

Every LO profile carries two availability flags: **Morning** and **Afternoon**. Both, either, or neither can be on. The algorithm uses availability as a hard filter for time-of-day routing and as a soft factor when ranking ties.

Morning (on)	LO is routed leads originating before the team's midday cutover.
Afternoon (on)	LO is routed leads originating after the midday cutover.
Both on	Standard setting for full-time LOs. No time-of-day restriction.
Both off	LO is treated as unavailable and will not appear on any CLR's calling list. Use this for PTO, training days, or temporary pauses.

SECTION 4

Appointments

4.1 What Is an Appointment?

An appointment is any scheduled callback or meeting a CLR books with a lead on behalf of an LO. Appointments live in their own tab and are distinct from the immediate live transfers captured only in EOD totals. If a lead asks to talk later, you create an appointment. If a lead takes the transfer right now, you do not.

4.2 Logging a New Appointment

- 01** Open the Appointments tab from the Main navigation group.
- 02** Click **+ New Appointment** in the top-right of the page.
- 03** Enter the lead name, contact number, and the assigned LO. Start typing the LO's name to search the active roster.
- 04** Pick the date and time. Past times are disabled; if the callback is outside business hours, note that in the description field.
- 05** Add a short context note: what the lead is shopping for, objections raised, any callback preference the lead mentioned.
- 06** Save. The appointment appears in Scheduled status and is visible on the Dashboard's Upcoming Appointments card.

DETAILS SAVE TRANSFERS

The quality of your context note determines whether the LO is ready when the callback happens. "Wants 30-year fixed, owner-occupied, credit ~720" is useful. "Good lead" is not. Treat the note as a handoff memo.

4.3 Statuses and Completion

Every appointment moves through a simple state machine: **Scheduled** upon creation, then **Transfer** or **Fell Through** once completed. There is no "in progress" intermediate state — you mark the outcome when the appointment ends.

Scheduled	Default status at creation. Appointment is upcoming or live. Remains here until you explicitly complete it.
Transfer	Completed outcome: the callback connected and the lead was successfully handed off to the LO. Counts toward your daily transfer total.
Fell Through	Completed outcome: the callback did not connect, the lead declined, or the transfer was refused. Does not count toward daily transfers, but is tracked for attempt volume.

Using the Complete Dialog

From the Appointments tab, click **Complete** on any Scheduled row. The dialog asks for the outcome (Transfer or Fell Through) and optional notes. Notes on Fell Through outcomes help identify patterns (bad contact info, timing issues, LO unavailability) that can be fixed upstream.

4.4 Dashboard and Overdue Views

The Dashboard surfaces an **Upcoming Appointments** metric that counts every appointment owned by you with a future date/time in Scheduled status. The Appointments tab additionally shows an **Overdue** section at the top for any Scheduled appointment whose time has passed. Overdue appointments should be completed (Transfer or Fell Through) before the end of the day — they pollute the dashboard if left unresolved.

OVERDUE = ACTION REQUIRED

An appointment is overdue the moment its scheduled time passes without a status change. Complete it. If the callback still has to happen, create a new appointment for the rescheduled time and mark the old one Fell Through with a "rescheduled" note.

SECTION 5

EOD Reporting

5.1 What Is EOD Reporting?

End-of-Day Reporting is the structured wrap-up every CLR submits at the close of each working day. It gives management a consistent, dated record of transfers, appointments, and any notable items that would not otherwise appear in the platform's metrics. The EOD is the single most important compliance step in your daily workflow.

5.2 Fields and Submission

Transfers	Auto-tallied from the day's completed appointments and any direct transfers logged in the system. You cannot edit this number; if it looks wrong, reconcile the underlying appointments first.
Appointments	Auto-tallied from new appointments you created today, regardless of their status. Also read-only on the EOD form.
Other notable work	Free-text field labeled "any other notable work done today not mentioned." Use it for training sessions, call coverage for a teammate, LO outreach, or anything else that does not fit in the auto-tallied numbers.

When to Submit

Submit EOD Reporting at the end of each working day, after your last scheduled appointment and after all of the day's appointments have been marked Transfer or Fell Through. Submitting early locks in incomplete numbers. Submitting late risks the next morning's popup reminder firing for the wrong day.

5.3 Email Delivery and Reminders

On submission, the platform emails the report via Resend to the two manager recipients: **Scott Petrie** and **Chris Redoble**. Delivery is near-instant. If Resend fails, the report is still stored in the platform — but manager visibility depends on the email, so a delivery failure is treated as a P1 issue.

The EOD Popup Reminder

When you log in on a day after one where EOD was not submitted, a modal appears reminding you to file yesterday's report. Key rules for the popup:

- It appears only **after your first login** on a new day, not during the same day's session.
- It does NOT appear on your **first-ever login** to the platform, since there is no prior EOD to remind about.
- It continues to appear every subsequent login until the missing EOD report is submitted or explicitly waived by an admin.
- Closing the modal without submitting does not waive the reminder — it will reappear.

5.4 Common Issues and Solutions

Popup won't go away	Submit the outstanding EOD. If there is genuinely nothing to report, submit with zeroes and a short note explaining (e.g., "PTO").
Transfer count looks wrong	Go to Appointments. Confirm each completed appointment has the correct outcome. The EOD tally recalculates live as you fix them.
Manager didn't receive email	Ask an admin to verify the Resend API key in Settings and check the recipient list. Re-submit once confirmed.
Submitted wrong day's numbers	Contact an admin. They can reopen the report for correction; the audit log captures both versions.

SECTION 6

Team Stats

6.1 Metrics Tracked

Team Stats aggregates individual and team-wide performance metrics into a single view. It is designed for two audiences: managers looking for trends, and CLRs looking for personal benchmarks. Stats are calculated from the same underlying data EOD Reporting uses, so the two views always reconcile.

Transfers	Total completed transfers over the selected window. The primary output metric of the team.
Appointments booked	Count of new appointments created, regardless of outcome. Captures outreach volume independent of conversion.
Conversion rate	Transfers divided by appointments that reached a terminal state (Transfer + Fell Through).
Calling-list throughput	Percentage of recommended LOs a CLR actually worked through on their daily list. See 6.3.
LO coverage	Number of distinct LOs each CLR routed to. Flags over-reliance on a narrow subset.

6.2 Individual CLR View

The top of Team Stats includes a **CLR dropdown filter**. Selecting your own name shows only your numbers; selecting another CLR shows theirs (managers and admins can view all). Selecting "All" returns the team-wide aggregate.

6.3 Calling-List Throughput

A signature Team Stats metric is the **percentage of recommended LOs a CLR gets through** each day. The algorithm produces an ordered list; this metric measures how far down that list each CLR actually worked. A low throughput number flags two possibilities: either the CLR ran out of leads, or they stopped calling through the list early.

THROUGHPUT IS NOT PERFORMANCE

Calling-list throughput measures activity against the day's plan, not conversion quality. A CLR can have 100% throughput and low conversion, or vice versa. Always read the two metrics together before drawing conclusions.

6.4 Timeframes and Reset Behavior

The default Team Stats view is the current calendar month. A timeframe selector at the top allows Today, This Week, This Month, Last Month, Quarter-to-Date, and Custom Range. Stats do not "reset" — the underlying data is retained indefinitely for audit and trend analysis. The selector simply changes the window used to aggregate.

SECTION 7

LO Management

7.1 Viewing the LO Roster

Open LO Management from the Tools menu. The roster lists every active LO with name, NMLS ID, priority tier, availability, and last-updated timestamp. Filters across the top toggle Active / Archived, and columns sort by clicking the header.

Adding a New LO

- 01** Click **+ Add LO** at the top-right of the roster.
- 02** Enter **NMLS ID**, **primary phone**, and **email**. All three are required — the system will not save without them.
- 03** Add the LO's **states licensed**. Select from the multi-state picker; only selected states are eligible for assignment routing.
- 04** Set **priority tier**. Standard is tier 2 and is the default. Leave it at Standard unless leadership has explicitly designated the LO as tier 1 or tier 3.
- 05** Set **availability** (Morning and/or Afternoon). Default is both.
- 06** Save. The LO immediately becomes eligible for the next day's assignment generation.

REQUIRED FIELDS ARE NON-NEGOTIABLE

An LO record without NMLS ID, phone, or email triggers a standing notification sent every 3 days to **every user** on the platform until the data is fixed. See Section 7.8. Fill it all in at creation time to avoid broadcasting your own cleanup work.

7.2 Editing LO Details

Any field on an LO profile is editable. Click the LO's row in the roster to open the detail pane, edit in place, and save. Edits are captured in the audit log with the user, timestamp, and before/after values. The algorithm picks up changes on the next day's generation — intraday edits do not change the already-locked list.

Priority Tiers

Tier 1	Top-performing LOs. Appear first in tie-break ordering. Reserve for LOs explicitly designated by leadership.
Tier 2 (Standard)	Default for new LOs and the vast majority of the roster. No elevated or suppressed weighting.
Tier 3	Under development or limited capacity. Appear later in ties. Useful for onboarding or performance probation.

Setting Availability

On the LO profile, toggle **Morning** and **Afternoon** independently. To pause an LO completely — PTO, training, temporary unavailability — turn both off; the LO will not appear on any calling list until one is re-enabled.

7.3 Archive, Delete, Restore

Removing an LO is a two-step ladder. **Archive** is the default remove action and is reversible. **Delete** is a permanent action reserved for bad test records.

Archive	Removes the LO from active routing but keeps all historical records. Reversible via Restore. Use this for LOs leaving the company or going on long leave.
Delete	Permanent removal. Confirm dialog required. Use only for test or duplicate records; never for real LOs, since it severs historical attribution.
Restore	Available on archived LOs. Opens the Archived view filter, click Restore on the target row. The LO returns to active roster with all prior settings intact.

CONFIRM BEFORE YOU DELETE

Delete requires an explicit confirmation dialog and writes a permanent audit entry. You cannot undo a Delete from inside the platform — engineering must restore from a backup, which is a P1 escalation. When in doubt, Archive.

7.4 Missing-Data Notifications (Important)

The platform actively guards LO record completeness. If any active LO is missing their **NMLS ID**, **phone number**, or **email**, the system sends a notification every **3 days** to all users identifying which record needs attention and which field is missing. The reminder stops only when the record is fixed or the LO is archived.

THE FASTEST FIX

Open LO Management, apply the built-in "Missing Data" filter, and resolve every flagged record in one sitting. The filter is sorted by oldest unresolved date. One complete pass stops the recurring broadcast for everyone.

SECTION 8

NMLS Compliance Checks

8.1 What Are NMLS Checks?

NMLS Compliance Checks are periodic audits of the active LO roster against the public NMLS registry. Each check verifies that every routed LO still holds a valid license in the states assigned to them on their profile. An LO whose license has lapsed or whose state coverage shifted must be corrected in the platform before they can receive any more transfers.

8.2 Schedule and Assignment

Checks run on a **two-month cadence**. When the cycle opens, the platform randomly assigns one CLR as the check owner. The assigned CLR is notified in Team Chat and by email, and the NMLS Compliance Checks page tracks progress item-by-item through the roster.

8.3 7-Day Escalation

If the assigned CLR has not completed the check within **7 days** of assignment, the platform escalates: a notification fires to **every user** identifying the assigned CLR and the overdue check. The notification recurs daily until the check is complete. The intent is visibility, not shame — the team should help finish the check, not pile on.

BASIC USERS CAN EDIT THE SCHEDULE

Unlike most settings, the NMLS check schedule is editable by any user — not admin-gated. This is intentional: whoever is closest to the compliance work can reassign, reschedule, or accelerate a cycle without waiting for admin availability. All schedule changes are still captured in the audit log.

8.4 Completing a Check

- 01** Open NMLS Compliance Checks from the Tools menu.
- 02** Review each flagged LO against the public NMLS registry (an external site).
- 03** For each LO, either confirm current licensing (no action needed) or update the LO's profile in LO Management if licenses have changed.
- 04** Mark the check complete when every LO row shows verified status.
- 05** The completion timestamp schedules the next cycle two months out.

SECTION 9

Team Chat

9.1 How to Use Team Chat

Team Chat is a single, shared channel visible to every user on the platform. It is the primary channel for platform-level announcements, LO status changes, shift handoffs, and urgent coordination. Team Chat is not a substitute for a ticketing system or for 1:1 manager conversations — it is for information the whole team benefits from.

Sending a Message

- 01** Open Team Chat from the Team menu group.
- 02** Type your message in the composer at the bottom. Links auto-linkify on send.
- 03** Send. Your message is visible immediately to every logged-in user.
- 04** For urgent issues, prefix the message with "URGENT:" or "FYI:" so readers can triage at a glance.

9.2 Notification Bubble

When new messages arrive while you are on another page, a **gold notification bubble** appears next to Team Chat in the left navigation. The number shows unread count since you last opened the channel. Opening Team Chat clears the bubble.

9.3 Visibility and Retention

Every user sees every message. There are no private channels or DMs in the current platform. Message history is retained indefinitely and is searchable from the Team Chat page. Because the channel is always public, **do not post sensitive customer data, credentials, or PII** in Team Chat — link to the record in the platform instead.

TEAM CHAT ETIQUETTE

One channel means noise is a real cost. Keep messages scoped, prefer a single message over a flurry of one-line fragments, and reply in-thread when a conversation needs more than a sentence. When coverage or LO status changes, post once with all of the details.

SECTION 10

Admin Functions

10.1 Admin vs. Admin-CLR

The platform has two admin-level roles, which share most permissions but behave very differently at the assignment algorithm layer.

Admin-only	Full system access: Manage Users, Settings, History, override powers, credentials. Does NOT appear in the daily assignment generation — this role is not a producer of transfers, and including them would skew workload distribution.
Admin-CLR	Full system access AND active participation in daily generation. Behaves like a regular CLR for assignment purposes while retaining admin controls. Use this for working leads while also managing the platform.

10.2 Managing CLR Accounts

Admin → Manage Users lists every account with role, status, and last-login. From here, admins add new CLRs, edit roles or emails, and deactivate departing users.

01 To **add** a user: click + Add User. Enter name, email, and role. The welcome-email toggle determines whether the platform emails the new user their initial credentials.

02 To **edit** a user: click the row. Change role (CLR / Admin-CLR / Admin-only), email, or display name. Role changes are logged.

03 To **delete** a user: click Delete on the row and confirm. Deletion revokes access but retains historical attribution. Deleted users do not appear in dropdowns but remain in audit logs.

THE WELCOME EMAIL TOGGLE

When adding a user, the welcome-email toggle is ON by default. Leave it on for real new hires; turn it off when creating service or test accounts you do not want notified.

10.3 Algorithm Weights and Credentials

The algorithm weight panel lives under Admin → Settings. Each of the six factors from Section 3 has a slider or numeric field. **Only admins can see this panel** — it is hidden even from Admin-CLRs if they do not also have admin-only privileges.

Bonzo and Lead Mailbox Credentials

On the main admin page, two credential cards are pinned near the top: **Bonzo** (CRM integration) and **Lead Mailbox** (inbound lead channel). Each card displays username, password, and a **Copy** button for one-click paste into the external service.

CREDENTIALS ARE STILL SECRETS

Copy buttons make credentials convenient, not less sensitive. Never paste them into Team Chat, email, or any external tool other than the Bonzo or Lead Mailbox login page. Rotate them on any suspected compromise.

10.4 History and Audit Log

The History page (Admin → History) is a chronological audit log of every material action taken on the platform. Filters narrow by user, action type, and date range. Every entry includes a full before/after payload so you can see exactly what changed.

Assignment generation & overrides	Date, admin, reason, prior list, new list. See Section 3.4.
User edits	Role changes, email updates, deletions, new user creation.
LO record changes	Adds, edits (field-level), archive, restore, delete.
Settings changes	Algorithm weights, email config, manager recipients, max LOs per day.
EOD submissions	Timestamp, submitter, report payload, email delivery status.

10.5 Override Procedure Recap

Section 3.4 specifies the full override flow. Restated for the admin context:

- Only admin and admin-CLR roles can unlock a locked day.
- The user must provide a **written reason** — blank or trivial reasons are rejected.
- **Triple confirmation** is required: date, list replacement, team communication.
- A full audit trail entry is written, and every active user is notified in Team Chat.

USE OVERRIDE SPARINGLY

A healthy platform needs overrides very rarely. If your team is overriding regularly, investigate root causes: stale LO data, misaligned availability, or algorithm weights that no longer match reality.

SECTION 11

Settings Reference

11.1 Algorithm Weights (Admin-only)

Each factor from Section 3 corresponds to a numeric weight. Defaults are calibrated on live book performance; tune only when you have a clear, data-backed reason.

Performance weight	How strongly conversion rate affects ranking. Raise to reward top LOs; lower to distribute more evenly across the roster.
Workload balance weight	How strongly current workload suppresses further assignment. Raise to enforce stricter caps; lower when volume is low and you want concentration.
State licensing weight	Effectively a hard filter when set to max. Lowering this weight is almost never correct.
Priority tier weight	Multiplier on manual tier in tie-breaks. Raise to let tier 1 LOs dominate; lower to rely more on performance.
Availability weight	Influence of morning/afternoon match on lead call time.
Recency weight	How strongly a recent transfer suppresses re-routing to the same LO. Raise for spread; lower when you want the fastest LOs consistently prioritized.

11.2 Email Settings

Resend API key	The platform sends all outbound email (EOD reports, notifications, welcome mails) through Resend. The key is stored in Settings → Email. Rotate it on any suspected compromise.
From address	The sender address on all outbound platform email. Changes here affect every recipient; coordinate with IT before modifying to avoid deliverability issues.
Manager recipients	The explicit list that receives EOD submissions: Scott Petrie and Chris Redoble . Additional recipients can be added — do not remove the two defaults without leadership approval.

11.3 Max LOs Per Day

The **Max LOs per day** setting caps how many distinct LOs may appear on a single CLR's calling list in a day. The algorithm respects this cap when composing the list. The default is tuned to the current team size and daily lead volume — raise it only when LO roster or lead volume grows; lower it if CLRs are not making it through their lists.

ALL SETTINGS CHANGES ARE AUDITED

Every setting in this section is captured in the audit log with before/after values, the admin who made the change, and the timestamp. Review the History page after every configuration session to confirm intended changes and catch fat-finger mistakes.

11.4 Review Cadence

Algorithm weights should be reviewed quarterly against Team Stats. Email settings and manager recipients should be reviewed whenever there is a leadership change. Max LOs per day should be revisited whenever the LO roster grows by more than 20% or shrinks materially.

SECTION 12

Troubleshooting

Use this section as a first-line diagnostic. Every entry lists the symptom, the most likely cause, and the fix. Escalate to an admin or engineering only after you have tried the suggested step.

"I can't generate assignments."	The day's list has already been generated and is locked, or you chose a past date. For today's re-generation, use the override procedure in Section 3.4. For a past date, there is no fix — past dates are permanently blocked (Section 3.3).
"An LO is missing from my list."	Most likely the LO is archived, or both availability flags are off. Open LO Management, filter for the LO, and confirm status (Active, not Archived) and availability (at least one of Morning/Afternoon on).
"The EOD popup won't stop appearing."	You have an unsubmitted EOD from a previous working day. Open EOD Reporting and submit it. If there is genuinely nothing to report, submit with zeroes and a short note.
"I'm not receiving emails from the platform."	Likely the Resend API key in Settings → Email is invalid or rate-limited. Ask an admin to verify the key, test send, and rotate if needed. Also confirm your email is not in a spam or safe-sender block list on the corporate mail server.

"An assignment was made incorrectly."	If the issue is today's list (wrong ranking, missing LO), an admin must run the override procedure in Section 3.4 with a written reason. If the issue is historical, correct the underlying appointment records instead — never attempt a back-dated regeneration.
"A CLR account shows the wrong role."	An admin must edit the user in Admin → Manage Users. Role changes take effect on next login and are recorded in the audit log. Affected user should log out and log back in.
"The NMLS missing-data notification keeps appearing."	One or more LOs are missing NMLS ID, phone, or email. Open LO Management, apply the "Missing Data" filter, and complete every flagged field. The recurring 3-day broadcast stops when every record is fixed.
"The Bonzo / Lead Mailbox Copy button isn't working."	Browser clipboard permissions block the copy. Grant clipboard access for the platform URL in your browser settings, or fall back to manually selecting and copying the credential.
"Team Chat notification bubble won't clear."	Open Team Chat — the bubble clears once the channel is viewed. If it persists after opening, refresh the page. Stuck bubbles after refresh are a platform bug; file a ticket.
"I can't see the Admin menu."	Your role is CLR, not Admin or Admin-CLR. Confirm with your manager; role changes require an admin edit in Manage Users.

WHEN TO ESCALATE

Any suspected data loss, bad email delivery, or stuck override is a P1 — message Team Chat with "URGENT" and notify an admin directly. Everything else in this section should be resolvable by the user or an on-call admin within the same shift.

SECTION 13

Quick Reference Card

One page. Print or pin. The essentials for every shift.

Daily CLR Checklist

- 01** Log in and check the Dashboard Upcoming Appointments metric.
- 02** Open Your Calling List — confirm today's assignments loaded.
- 03** Call top-down through the list; do not skip LOs without cause.
- 04** Log every appointment as you book it; include a handoff context note.
- 05** Complete each appointment with Transfer or Fell Through.
- 06** Check Team Chat throughout the day for updates.
- 07** End of day: open EOD Reporting, review auto-tallies, add notable notes.
- 08** Submit EOD. Confirm delivery to Scott Petrie and Chris Redoble.

Key Contacts

Scott Petrie	Manager · EOD recipient · platform escalations
Chris Redoble	Manager · EOD recipient · platform escalations
Admin on shift	Override authority · user management · settings changes

Admin Emergency Steps

- 01** Identify the incident type: data, email, assignment, or access.
- 02** Post "URGENT:" in Team Chat with a one-sentence description.
- 03** Wrong assignments: Settings → Generate Daily Assignments → Override with reason, triple-confirm.
- 04** Missing emails: Settings → Email, test Resend API key, rotate if compromised.
- 05** Missing LO data: LO Management → Missing Data filter, resolve in one pass.
- 06** Document the incident in the audit log; every override is reviewed by management.
